## Introduction

#### **Index Objective**

Each index in the S&P Managed Risk Index Series is designed to measure the performance of a dynamic allocation that seeks to achieve a target level of volatility by allocating between an underlying equity index and cash, based on the realized volatilities in the underlying equity and bond indices, while maintaining a fixed allocation to an underlying bond index. The exposure to the underlying equity index includes a synthetic put position, which is designed to measure the hedging of downside risk, implemented using a delta adjustment to the equity exposure.

#### Collaboration

The S&P Managed Risk Index Series is generated and published under agreements between S&P Dow Jones Indices and Milliman Financial Risk Management LLC.

#### **Highlights**

Each S&P Managed Risk Index allocates to the underlying equity index based on the realized volatilities of the underlying equity and bond indices.

The allocation to the underlying bond index is fixed at level ( $W_B$ ) as daily adjustments are not warranted. The target allocation to the underlying equity index is calculated to maintain a target volatility level and is capped based on the maximum leverage of the index.

Each index includes a constant maturity put option on the underlying equity index to measure the hedging of downside risk. To remove the risk-free rate in the calculation of the Black-Scholes delta of the put, the strike of the option is expressed in "forward moneyness" terms. This forward strike is determined each day by multiplying the moving average of the index level with a strike multiplier.

Please refer to the appendix for a full list of index parameters.

#### **Supporting Documents**

This methodology is meant to be read in conjunction with supporting documents providing greater detail with respect to the policies, procedures and calculations described herein. References throughout the methodology direct the reader to the relevant supporting document for further information on a specific topic. The list of the main supplemental documents for this methodology and the hyperlinks to those documents is as follows:

Supporting Document	URL
S&P Dow Jones Indices' Equity Indices Policies & Practices Methodology	Equity Indices Policies & Practices

This methodology was created by S&P Dow Jones Indices to achieve the aforementioned objective of measuring the underlying interest of each index governed by this methodology document. Any changes to or deviations from this methodology are made in the sole judgment and discretion of S&P Dow Jones Indices so that the index continues to achieve its objective.

## **Index Construction**

#### **Approaches**

Each S&P Managed Risk Index allocates to an underlying equity index based on the realized volatility in the underlying equity index. The underlying bond index has a fixed allocation,  $W_B$ .

To calculate the target allocation to the underlying equity index, the S&P Managed Risk Index:

- Uses an exponentially weighted risk control model to calculate the realized variance of both the underlying equity and bond indices, and the realized covariance between the two underlying indices.
- 2. Solves quadratic equations to calculate the weight of the underlying equity index that equates the portfolio realized volatility to the target volatility.
- 3. Adjusts the equity allocation weight based on a put overlay calculation, and applies a cap based on  $W_B$  and the maximum leverage of the index.

The index includes a constant maturity put option on the index designed to measure the hedging of downside risk. The forward strike level of the put is a multiple of the moving average of the index level. The index then calculates the delta of the put position with regard to the index level, and proportionally adjusts the effective weight of the underlying equity index.

This put overlay strategy essentially results in a synthetic portfolio made up of three components:

- 1. A fixed allocation to the underlying bond index.
- 2. A dynamic allocation to the underlying equity index that is reduced by the delta of the put option.
- 3. A cash allocation which is 100% minus the allocations in 1 and 2 above.

#### Rebalancing

The indices are rebalanced daily.

#### **Total Return Index Calculations**

On any business day *t*, the total return index value is calculated as:

$$IndexTR_{t} = AdjW_{E,t-2} * \left(\frac{E_{t}}{E_{t-1}} - 1\right) + W_{B} * \left(\frac{B_{t}}{B_{t-1}} - 1\right) + (1 - AdjW_{E,t-2} - W_{B}) * \left(InterestRate_{t-1} * \frac{NumDays_{t}}{360}\right)$$
(1)

where:

 $AdjW_{E.t}$  = Adjusted effective weight of the underlying equity index on day t, as defined in formula (7).

 $W_B$  = Fixed allocation to the underlying bond index.

 $E_t$  = The underlying equity index level on day t.

 $B_t$  = The underlying bond index level on day t.

InterestRate<sub>t-1</sub> = Interest rate on day t-1, as detailed in the appendix.

 $NumDays_t$  = Number of calendar days between day t-1 and t.

#### **Allocations**

**Exponentially Weighted Variance and Covariance.** On any business day *t*, the index calculates the realized short-term and long-term variances and covariances of the underlying equity and bond indices. The calculations are based on exponentially weighted moving averages.

The short-term equity variance measure at time t.

$$EquityVari\ ance_{S,t} = \begin{cases} \lambda_{S} * EquityVari\ ance_{S,t-1} + (1 - \lambda_{S}) * \left[ \ln \left( \frac{E_{t}}{E_{t-n}} \right) \right]^{2} \text{K if K } t > T_{0} \\ \sum_{i=m+1}^{T_{0}} \frac{\alpha_{S,i,m}}{WF_{S}} * \left[ \ln \left( \frac{E_{i}}{E_{i-n}} \right) \right]^{2} \text{K if K } t = T_{0} \end{cases}$$
(2a)

The long-term equity variance measure at time t.

$$EquityVari\ ance_{L,t} = \begin{cases} \lambda_{L} * EquityVari\ ance_{L,t-1} + (1 - \lambda_{L}) * \left[ \ln \left( \frac{E_{t}}{E_{t-n}} \right) \right]^{2} \text{K if K } t > T_{0} \\ \sum_{i=m+1}^{T_{0}} \frac{\alpha_{L,i,m}}{WF_{L}} * \left[ \ln \left( \frac{E_{i}}{E_{i-n}} \right) \right]^{2} \text{K if K } t = T_{0} \end{cases}$$
(2b)

The short-term bond variance measure at time t:

$$BondVariance_{S,t} = \begin{cases} \lambda_{S} * BondVariance_{S,t-1} + (1 - \lambda_{S}) * \left[ \ln \left( \frac{B_{t}}{B_{t-n}} \right) \right]^{2} \text{K if K } t > T_{0} \\ \sum_{i=m+1}^{T_{0}} \frac{\alpha_{S,i,m}}{WF_{S}} * \left[ \ln \left( \frac{B_{i}}{B_{i-n}} \right) \right]^{2} \text{K if K } t = T_{0} \end{cases}$$
(2c)

The long-term bond variance measure at time t.

$$BondVariance_{L,t} = \begin{cases} \lambda_{L} * BondVariance_{L,t-1} + (1 - \lambda_{L}) * \left[ \ln \left( \frac{B_{t}}{B_{t-n}} \right) \right]^{2} \text{K if K } t > T_{0} \\ \sum_{i=m+1}^{T_{0}} \frac{\alpha_{L,i,m}}{WF_{L}} * \left[ \ln \left( \frac{B_{i}}{B_{i-n}} \right) \right]^{2} \text{K if K } t = T_{0} \end{cases}$$
(2d)

The short-term covariance measure at time t.

$$Co \operatorname{var} iance_{S,t} = \begin{cases} \lambda_{S} * Co \operatorname{var} iance_{S,t-1} + (1 - \lambda_{S}) * \left[ \ln \left( \frac{E_{t}}{E_{t-n}} \right) \right] \left[ \ln \left( \frac{B_{t}}{B_{t-n}} \right) \right] \operatorname{K} if \operatorname{K} t > T_{0} \\ \sum_{i=m+1}^{T_{0}} \frac{\alpha_{S,i,m}}{WF_{S}} * \left[ \ln \left( \frac{E_{t}}{E_{t-n}} \right) \right] \left[ \ln \left( \frac{B_{i}}{B_{i-n}} \right) \right] \operatorname{K} if \operatorname{K} t = T_{0} \end{cases}$$
(2e)

The long-term covariance measure at time t.

$$Co \text{ var } iance_{L,t} = \begin{cases} \lambda_{L} * Co \text{ var } iance_{L,t-1} + (1 - \lambda_{L}) * \left[ \ln \left( \frac{E_{t}}{E_{t-n}} \right) \right] \left[ \ln \left( \frac{B_{t}}{B_{t-n}} \right) \right] \text{K } if \text{ K } t > T_{0} \\ \sum_{i=m+1}^{T_{0}} \frac{\alpha_{L,i,m}}{WF_{L}} * \left[ \ln \left( \frac{E_{t}}{E_{t-n}} \right) \right] \left[ \ln \left( \frac{B_{i}}{B_{i-n}} \right) \right] \text{K } if \text{ K } t = T_{0} \end{cases}$$

$$(2f)$$

where:

 $E_t$  = The underlying equity index level at time t.

 $B_t$  = The underlying bond index level at time t.

 $T_0$  = The start date of the S&P Managed Risk Index.

The number of days in the return calculation. n = 1 as daily returns are used to calculate realized volatility.

m = The m<sup>th</sup> trading date prior to  $T_0$ .

N = The number of trading days observed for calculating the initial variance as of the start date of the index. N = 60.

 $\lambda_s$  = The short-term decay factor used for exponential weighting. The decay factor is a number greater than zero and less than one that determines the weight of each daily return in the calculation of historical variance.  $\lambda_s = 0.94$ .

 $\lambda_L$  = The long-term decay factor used for exponential weighting. The decay factor is a number greater than zero and less than one that determines the weight of each daily return in the calculation of historical variance,  $\lambda_L = 0.97$ .

 $\alpha_{S,m,i}$  = Weight of date t in the short-term volatility calculation, as calculated based on the following formula:

$$\alpha_{S,t} = (1 - \lambda_S) * \lambda_S^{N+m-i} \tag{3a}$$

$$WF_S = \sum_{i=m+1}^{T_0} \alpha_{S,i,m} \tag{3b}$$

 $\alpha_{L,m,i}$  = Weight of date t in the long-term volatility calculation, as calculated based on the following formula:

$$\alpha_{L,t} = (1 - \lambda_L) * \lambda_L^{N+m-i} \tag{3c}$$

$$WF_L = \sum_{i=m+1}^{T_0} \alpha_{L,i,m} \tag{3d}$$

**Index Weight and Rebalancing.** On any business day *t*, the index calculates the target weight for the underlying equity index as follows:

$$W_{E,t} = Min(W_{E,S,t}, W_{E,L,t}) \tag{4}$$

where:

 $W_{E,t}$  = The weight of the underlying equity index at time t.

 $W_{E,S,t}$  = The weight of the underlying equity index at time t, that solves the short-term target variance equation:

$$TV^{2} = W_{E,S,t}^{2} * EquityVariance_{S,t} + W_{B}^{2} * BondVariance_{S,t}$$

$$+ 2 * W_{E,S,t} * W_{B} * Co \text{ var } iance_{S,t}$$
(5a)

 $W_{E,L,t}$  = The weight of the underlying equity index at time t, that solves the long term target variance equation:

$$TV^{2} = W_{E,L,t}^{2} * EquityVariance_{L,t} + W_{B}^{2} * BondVariance_{L,t} + 2*W_{E,L,t} * W_{B} * Co \text{ var } iance_{L,t}$$
(5b)

where:

TV = Target volatility

 $W_B$  = Fixed allocation to the bond index

Note: When solving for equations (5a) and (5b),

- If there are multiple acceptable solutions, the maximum is used.
- If there are no acceptable solutions, zero is used.

**Put Option Selection.** On any business day t, the index will have replicated a constant maturity put option on the underlying equity index with a forward strike that is a multiple k of the moving average of the index level. The option delta of the put is calculated from standard Black-Scholes as:

$$\lambda_k = 1 - (1/(252 *AvgPeriod))$$

$$MovingAverage_{t} = \begin{cases} \lambda_{k} * MovingAverage_{t-1} + (1 - \lambda_{k}) * IndexTR_{t} \text{ K if K } t > T_{0} \\ IndexTR_{t} \text{ K if K } t = T_{0} \end{cases}$$

$$d_{1} = \frac{\ln\left(\frac{IndexTR_{t}}{k*MovingAverage_{t}}\right) + \left(\frac{TV^{2}}{2}\right)*T}{TV*\sqrt{T}}$$
(6)

$$\Delta_{t} = -N(-d_{1})$$

where:

 $\lambda_k$  = The mean-reversion strength factor used for exponential weighting. It determines the weight of each daily index level in the calculation of moving average.

AvgPeriod = A parameter for the index that specifies the speed of mean reversion. Please refer to the appendix for the values used.

k = The multiplier of the put strike. This parameter impacts the forward moneyness of the put option. k = 0.875.

T = Time to maturity. T = 5 years.

N(x) = Standard normal cumulative distribution function.

**Adjusted Effective Equity Weight.** On any business day *t*, the index adjusts the weight of the underlying equity index using the delta of the put option overlay, subject to a cap based on the maximum allowable leverage and the fixed allocation to the underlying bond index. The index calculates the adjusted effective equity weight as follows:

$$AdjW_{E,t} = \max(0, \min(MaxLeverage - W_B, W_{E,t} + \Delta_t * W_{E,t}))$$
(7)

where:

MaxLeverage = The maximum leverage level of the index, which is 100%.

## **Index Governance**

#### **Index Committee**

S&P Dow Jones Indices' Global Benchmarks Index Committee maintains the indices. All Committee members are full-time professional members of S&P Dow Jones Indices' staff. The Index Committee meets monthly. At each meeting, the Index Committee reviews any significant market events. In addition, the Index Committee may revise index policy for timing of rebalancings or other matters.

S&P Dow Jones Indices considers information about changes to its indices and related matters to be potentially market moving and material. Therefore, all Index Committee discussions are confidential.

S&P Dow Jones Indices' Index Committees reserve the right to make exceptions when applying the methodology if the need arises. In any scenario where the treatment differs from the general rules stated in this document or supplemental documents, clients will receive sufficient notice, whenever possible.

In addition to the daily governance of indices and maintenance of index methodologies, at least once within any 12-month period, the Index Committee reviews the methodology to ensure the indices continue to achieve the stated objectives, and that the data and methodology remain effective. In certain instances, S&P Dow Jones Indices may publish a consultation inviting comments from external parties.

For information on Quality Assurance and Internal Reviews of Methodology, please refer to S&P Dow Jones Indices' Equity Indices Policies & Practices document and/or Fixed Income Policies & Practices document.

# **Index Policy**

#### **Announcements**

Announcements of the daily index values are made after the market close each day.

#### **Holiday Schedule**

Each index is calculated daily when the underlying equity index is calculated.

A complete holiday schedule for the year is available at www.spdji.com.

#### Rebalancing

The index committee may change the date of a given rebalancing for reasons including market holidays occurring on or around the scheduled rebalancing date. Any such change will be announced with proper advance notice where possible.

#### **Unexpected Exchange Closures**

For information on Unexpected Exchange Closures, please refer to S&P Dow Jones Indices' Equity Indices Policies & Practices document.

#### **Recalculation Policy**

For more information on the recalculation policy, please refer to S&P Dow Jones Indices' Equity Indices Policies & Practices and Fixed Income Policies & Practices documents for the underlying equity index and bond index, respectively.

For information on Calculations and Pricing Disruptions, Expert Judgment and Data Hierarchy, please refer to S&P Dow Jones Indices' Equity Indices Policies & Practices and Fixed Income Policies & Practices documents for the underlying equity index and bond index, respectively.

#### **Contact Information**

For questions regarding an index, please contact: <a href="mailto:index\_services@spglobal.com">index\_services@spglobal.com</a>.

## **Index Dissemination**

Index levels are available through S&P Dow Jones Indices' Web site at <a href="www.spdji.com">www.spdji.com</a>, major quote vendors (see codes below), numerous investment-oriented Web sites, and various print and electronic media.

#### **Tickers**

The table below lists headline indices covered by this document. All currency, currency hedged, risk control, and return type versions of the below indices that may exist are also covered by this document. Please contact <a href="mailto:index\_services@spglobal.com">index\_services@spglobal.com</a> for a complete list of indices covered by this document.
